PROFESSIONAL SUMMARY

Full-stack developer with a physics-trained, first-principles approach to engineering, actively growing into a cloud security engineer. I write the technical documentation before I write the code, build complete web applications, and apply secure coding practices at every step. Currently pursuing a Professional Master's degree in Cybersecurity, and combining a deep understanding of how software is built with how it is attacked.

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, SQL, HTML, CSS

Frontend: React, Next.js, Tailwind CSS

Backend: Django, Django REST Framework, FastAPI, Express.js, Node.js

Databases & Infra: PostgreSQL, MongoDB, Docker, Git & version control, REST APIs

Security (Actively working on): Network security, penetration testing (Nmap, Wireshark), Suricata IDS, IAM, incident response, cloud fundamentals (AWS), secure SDLC

EDUCATION

- Professional Master's degree in Cybersecurity — University of Bamenda (2025–Present)
- Bachelor of Science in Physics — University of Bamenda (2021–2025)

PROJECTS

Circuit Forge — Custom PC E-Commerce Platform — *Full-Stack · Django, JavaScript, PostgreSQL, Docker*

- Built an e-commerce platform for custom PC building with a dynamic component compatibility checker.
- Designed a relational schema mapping socket types, power requirements, and dimensions to prevent invalid builds at checkout.
- Integrated real-time inventory tracking, multistep checkout, and an admin analytics dashboard.

SecureBank Incident Simulation — Red Team / Blue Team — *Security · Suricata IDS, Nmap, Wireshark, Linux*

- Conducted web exploitation and privilege escalation (Red Team), then hardened systems and deployed Suricata IDS (Blue Team).
- Engineered Suricata threshold rules that reduced false positives by 85% while catching stealthy Nmap scans.

Malware Classification System — *Security / ML · Python, Scikit-Learn, Pandas*

- Built a static feature extraction pipeline and compared SVM, Neural Network, and GAN-augmented classifiers for malware detection from PE headers.
- Applied SMOTE oversampling and hyperparameter tuning to boost recall on rare malware variants.

Replicated Key-Value Store — *Distributed Systems · Python, Sockets*

- Implemented a fault-tolerant master-replica key-value store with synchronous replication and heartbeat failure detection.
- Achieved read-your-writes consistency via client vector clocks and logical timestamps.

CORE COMPETENCIES

- Full-Stack Development — End-to-end delivery from database schema to user interface
- Secure Development — Threat modeling, secure coding, OWASP Top 10 mitigations
- Technical Writing — Documenting architecture and security requirements before implementation
- Analytical Problem Solving — Physics background enables solution centered reasoning and debugging
- Systems Thinking — Distributed architecture, consistency models, and failure handling
